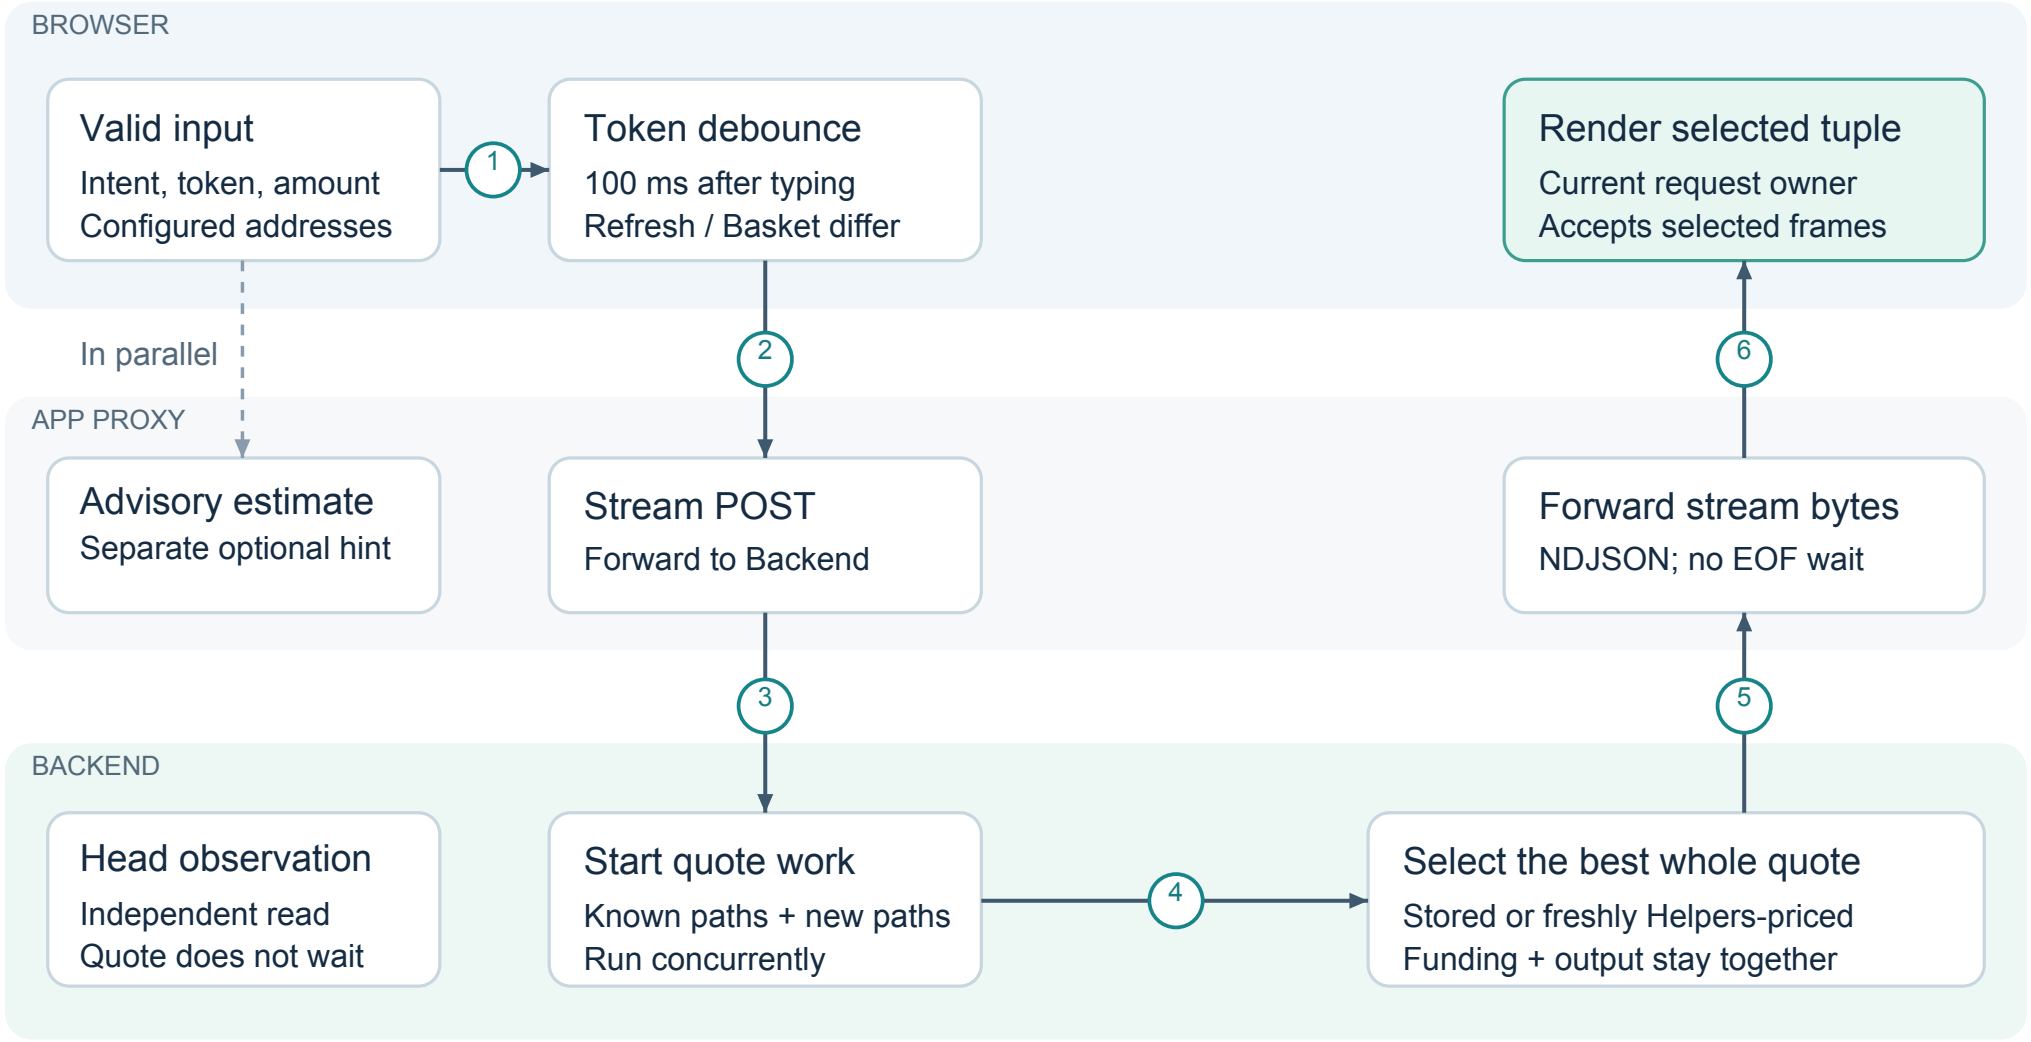
CYBERGOLD · CURRENT QUOTER · 01

From App input to a selected quote

Exact-input token flow · the stream stays open while the search improves the result

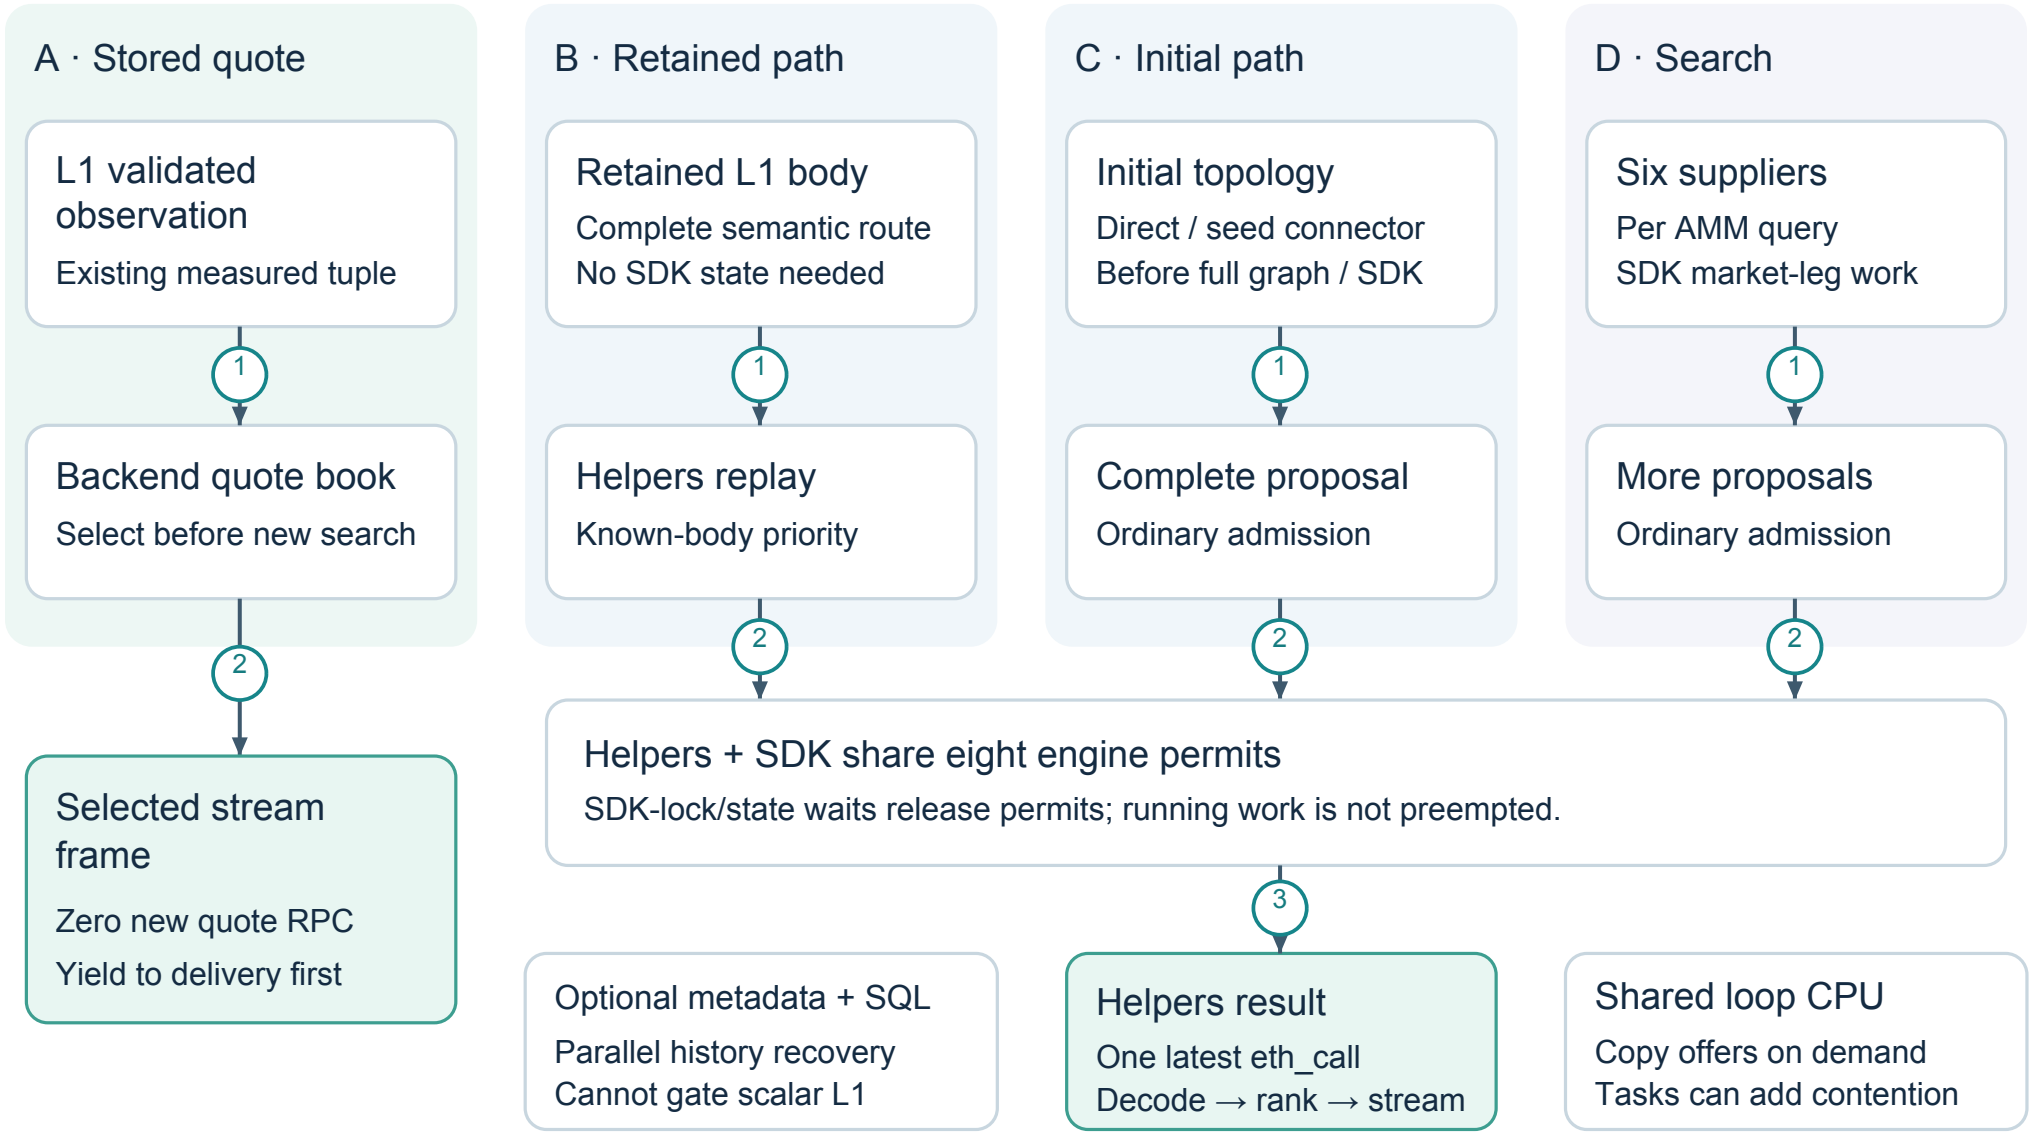


Stored and newly priced quotes are Helpers-validated. Arithmetic estimates are not.
A full-budget estimate can cover a stored partial quote while refining an unknown input limit.
Current-search pricing, full funding or a known input limit ends that advisory overlay.

Sources: App useEconomicQuote / economicQuoteSearch / backend-client; Backend progressive_quotes / quote_publication.

Fast results and continued search run together

Current scalar quotation · no supplier-completion wait is required before a selected frame



Before route/split expansion: skip only V3/V4 pools observed with sqrtRatioX96 = 0 in this search.
Unknown and initialized zero-liquidity pools remain eligible. Stored delivery and Helpers replay stay independent.

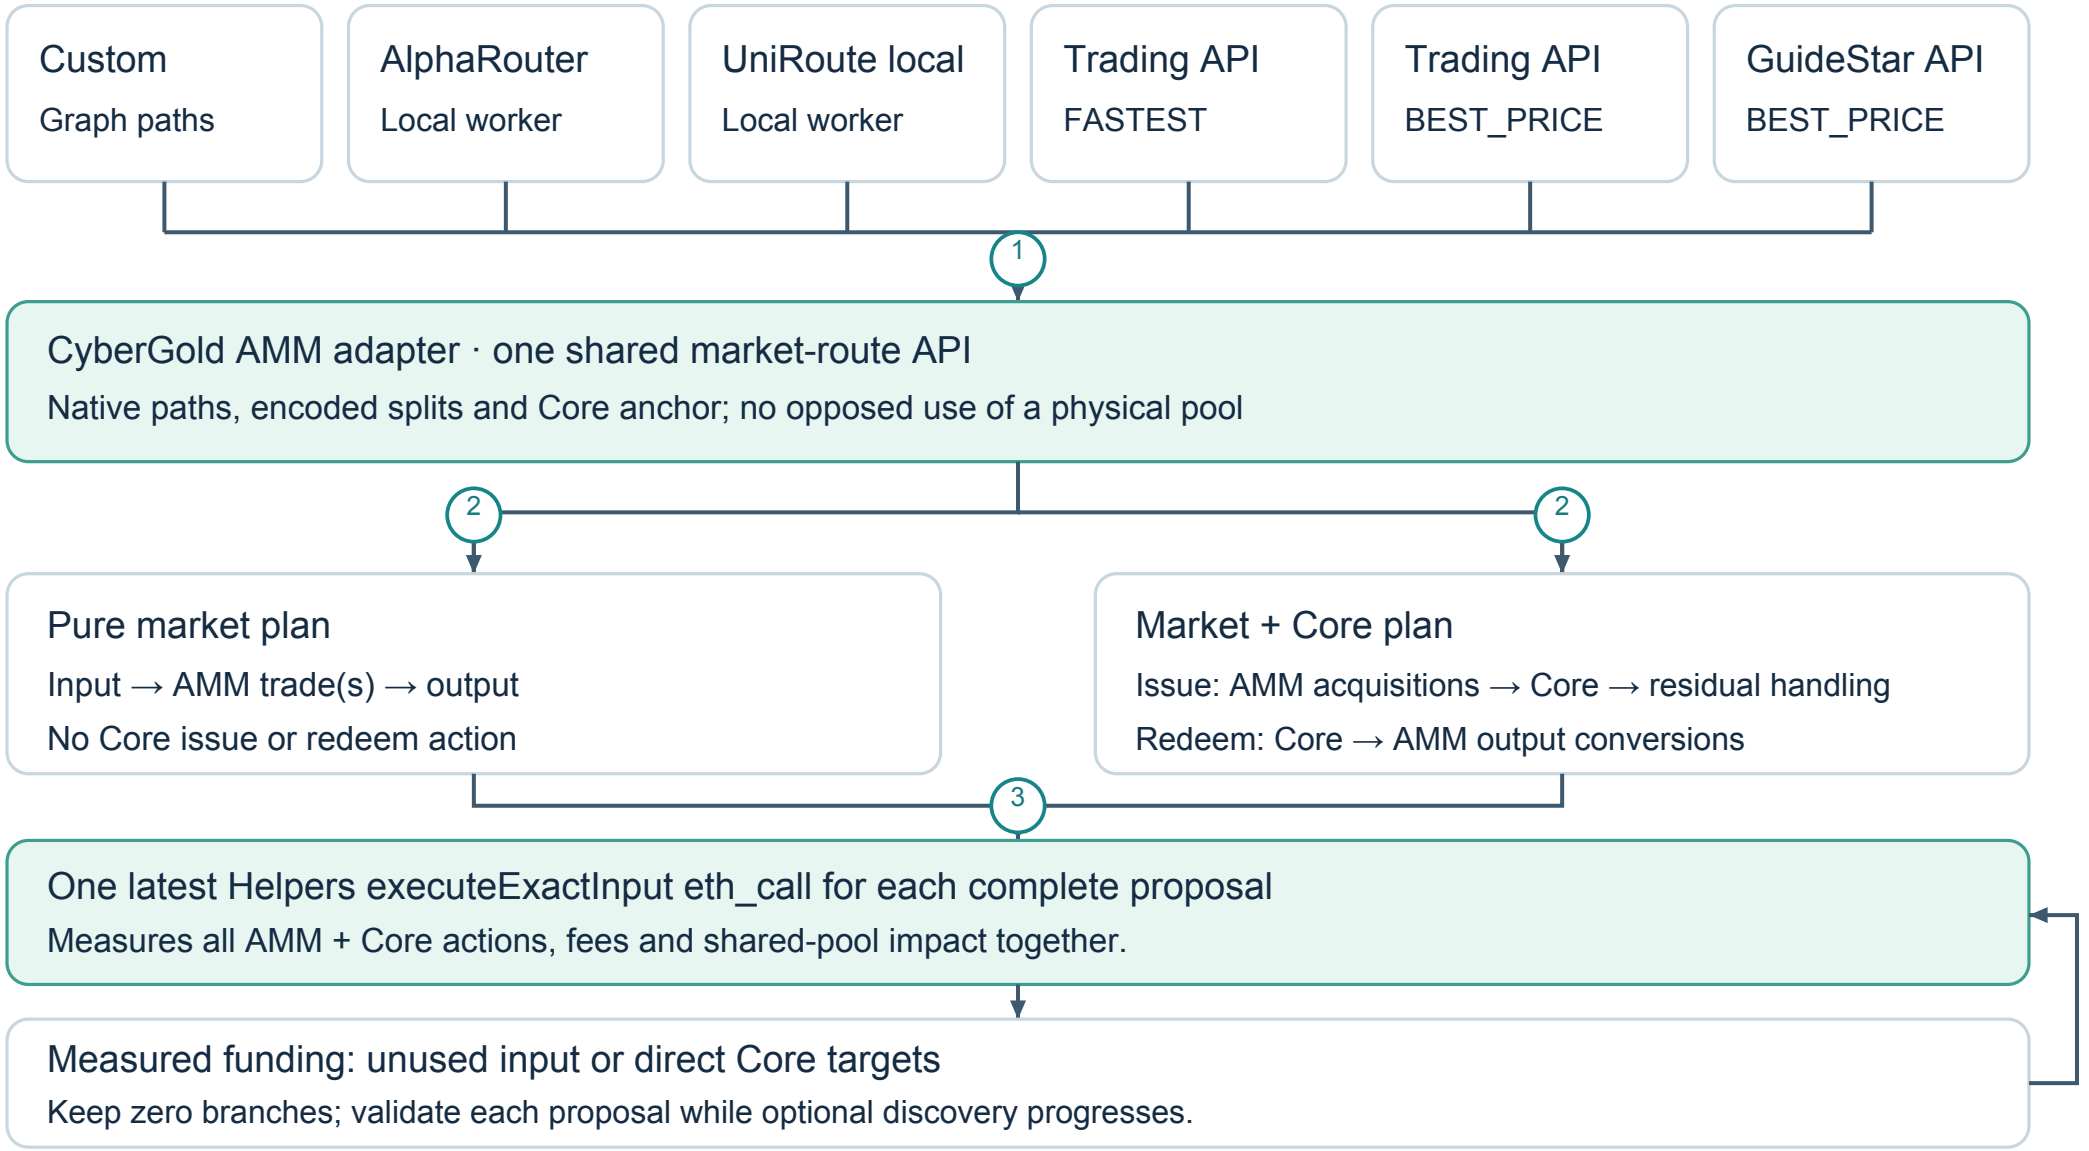
The same market tools serve both path families

Tools nominate AMM routes; Helpers measures the complete plan

Six parallel suppliers, started when a market-segment query is requested



One finite pass per root; each changed complete body returns to Helpers before selection.
