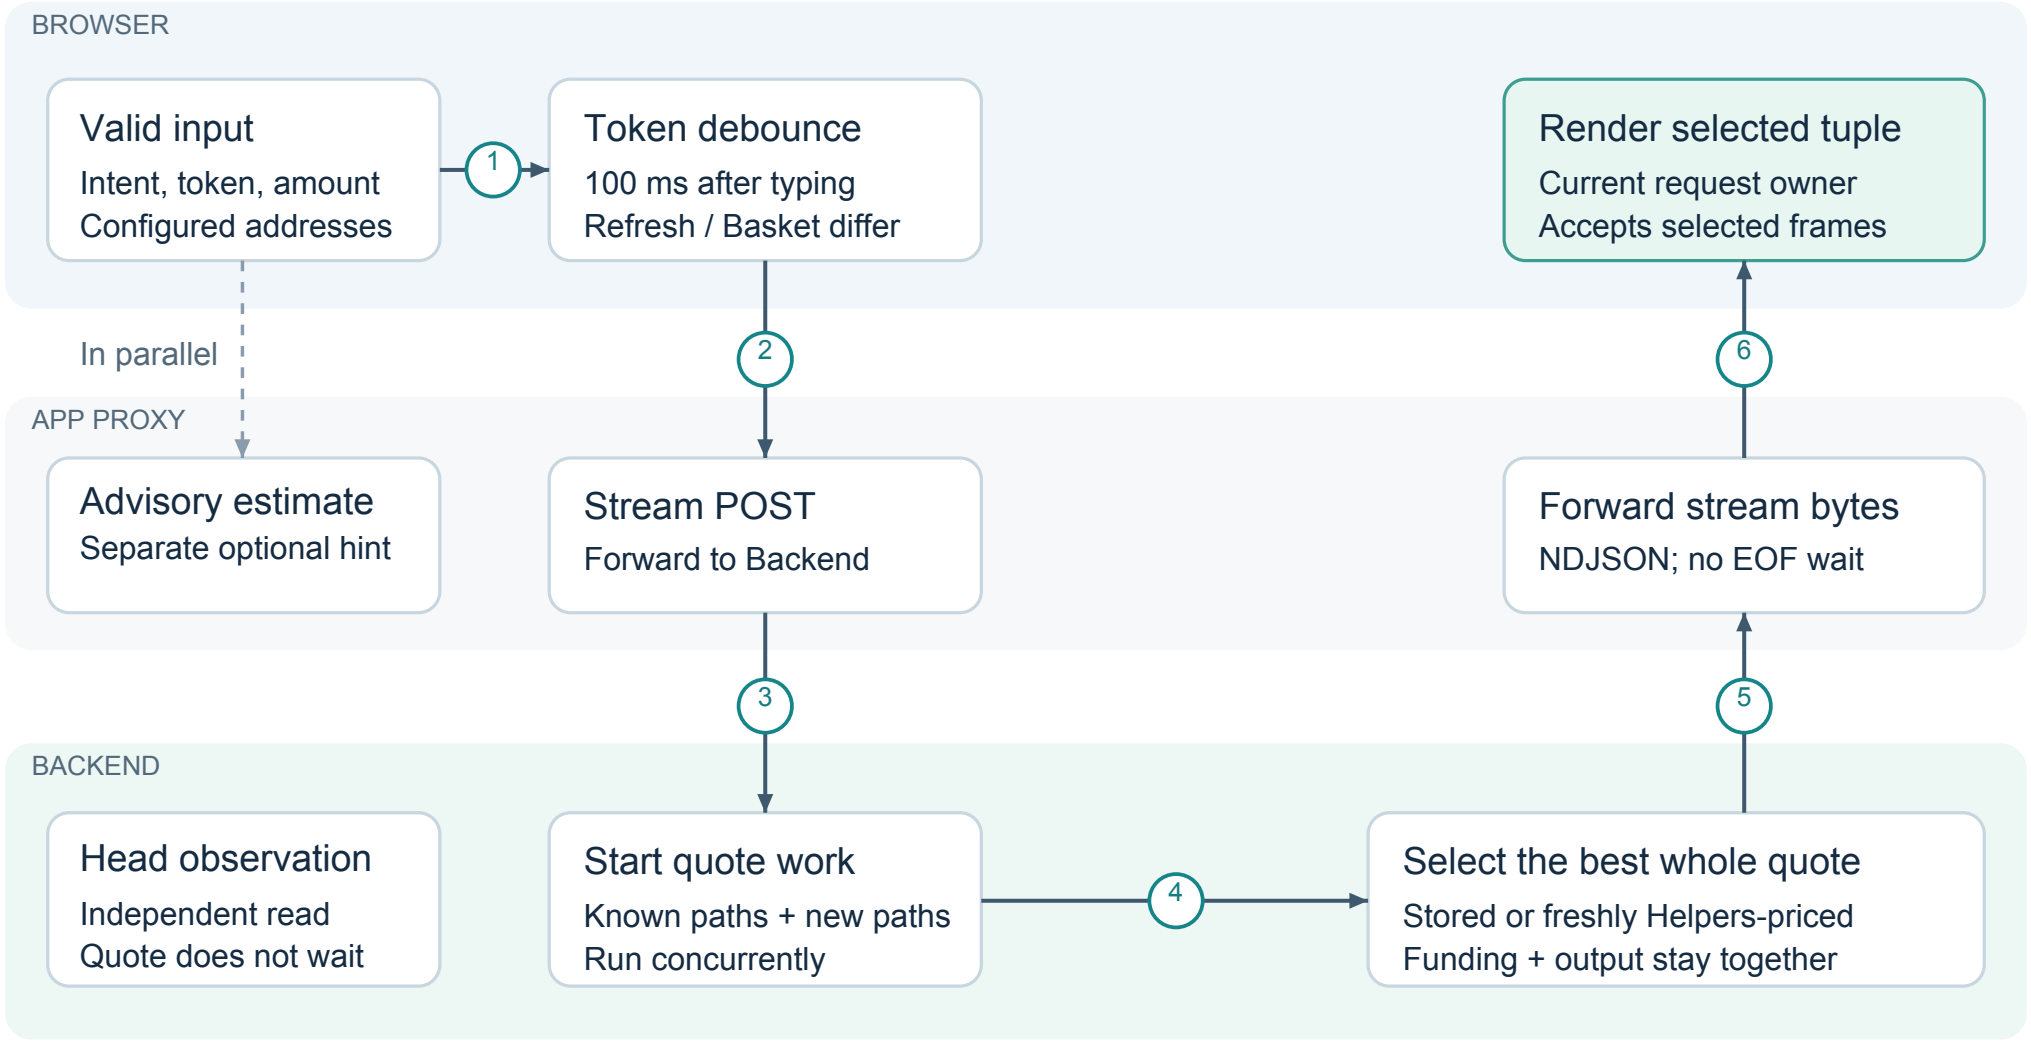
CYBERGOLD · CURRENT QUOTER · 01

From App input to a selected quote

Exact-input token flow · the stream stays open while the search improves the result

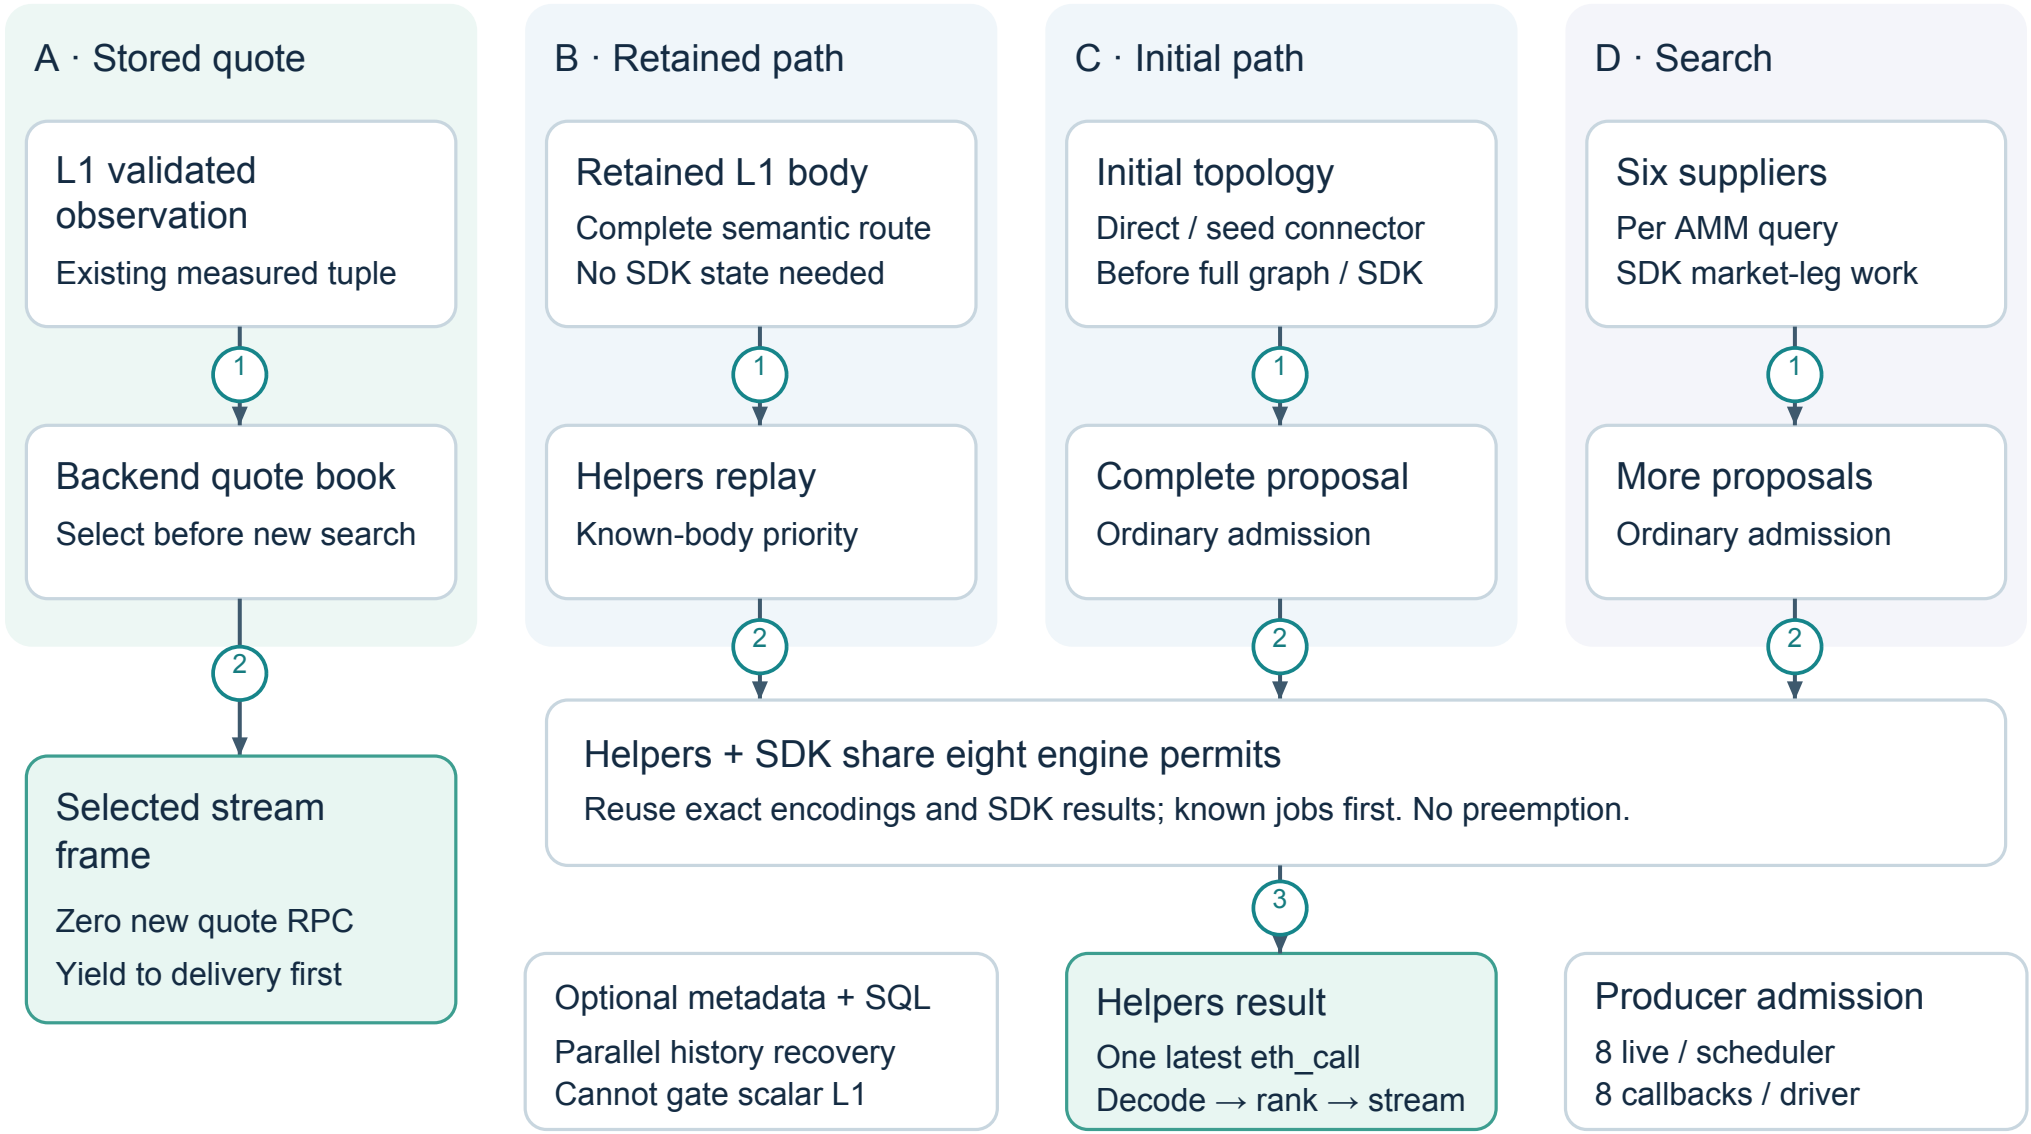


Stored and newly priced quotes are Helpers-validated. Arithmetic estimates are not.
A full-budget estimate can cover a stored partial quote while refining an unknown input limit.
Current-search pricing, full funding or a known input limit ends that advisory overlay.

Sources: App useEconomicQuote / economicQuoteSearch / backend-client; Backend progressive_quotes / quote_publication.

Fast results and continued search run together

Current scalar quotation · no supplier-completion wait is required before a selected frame



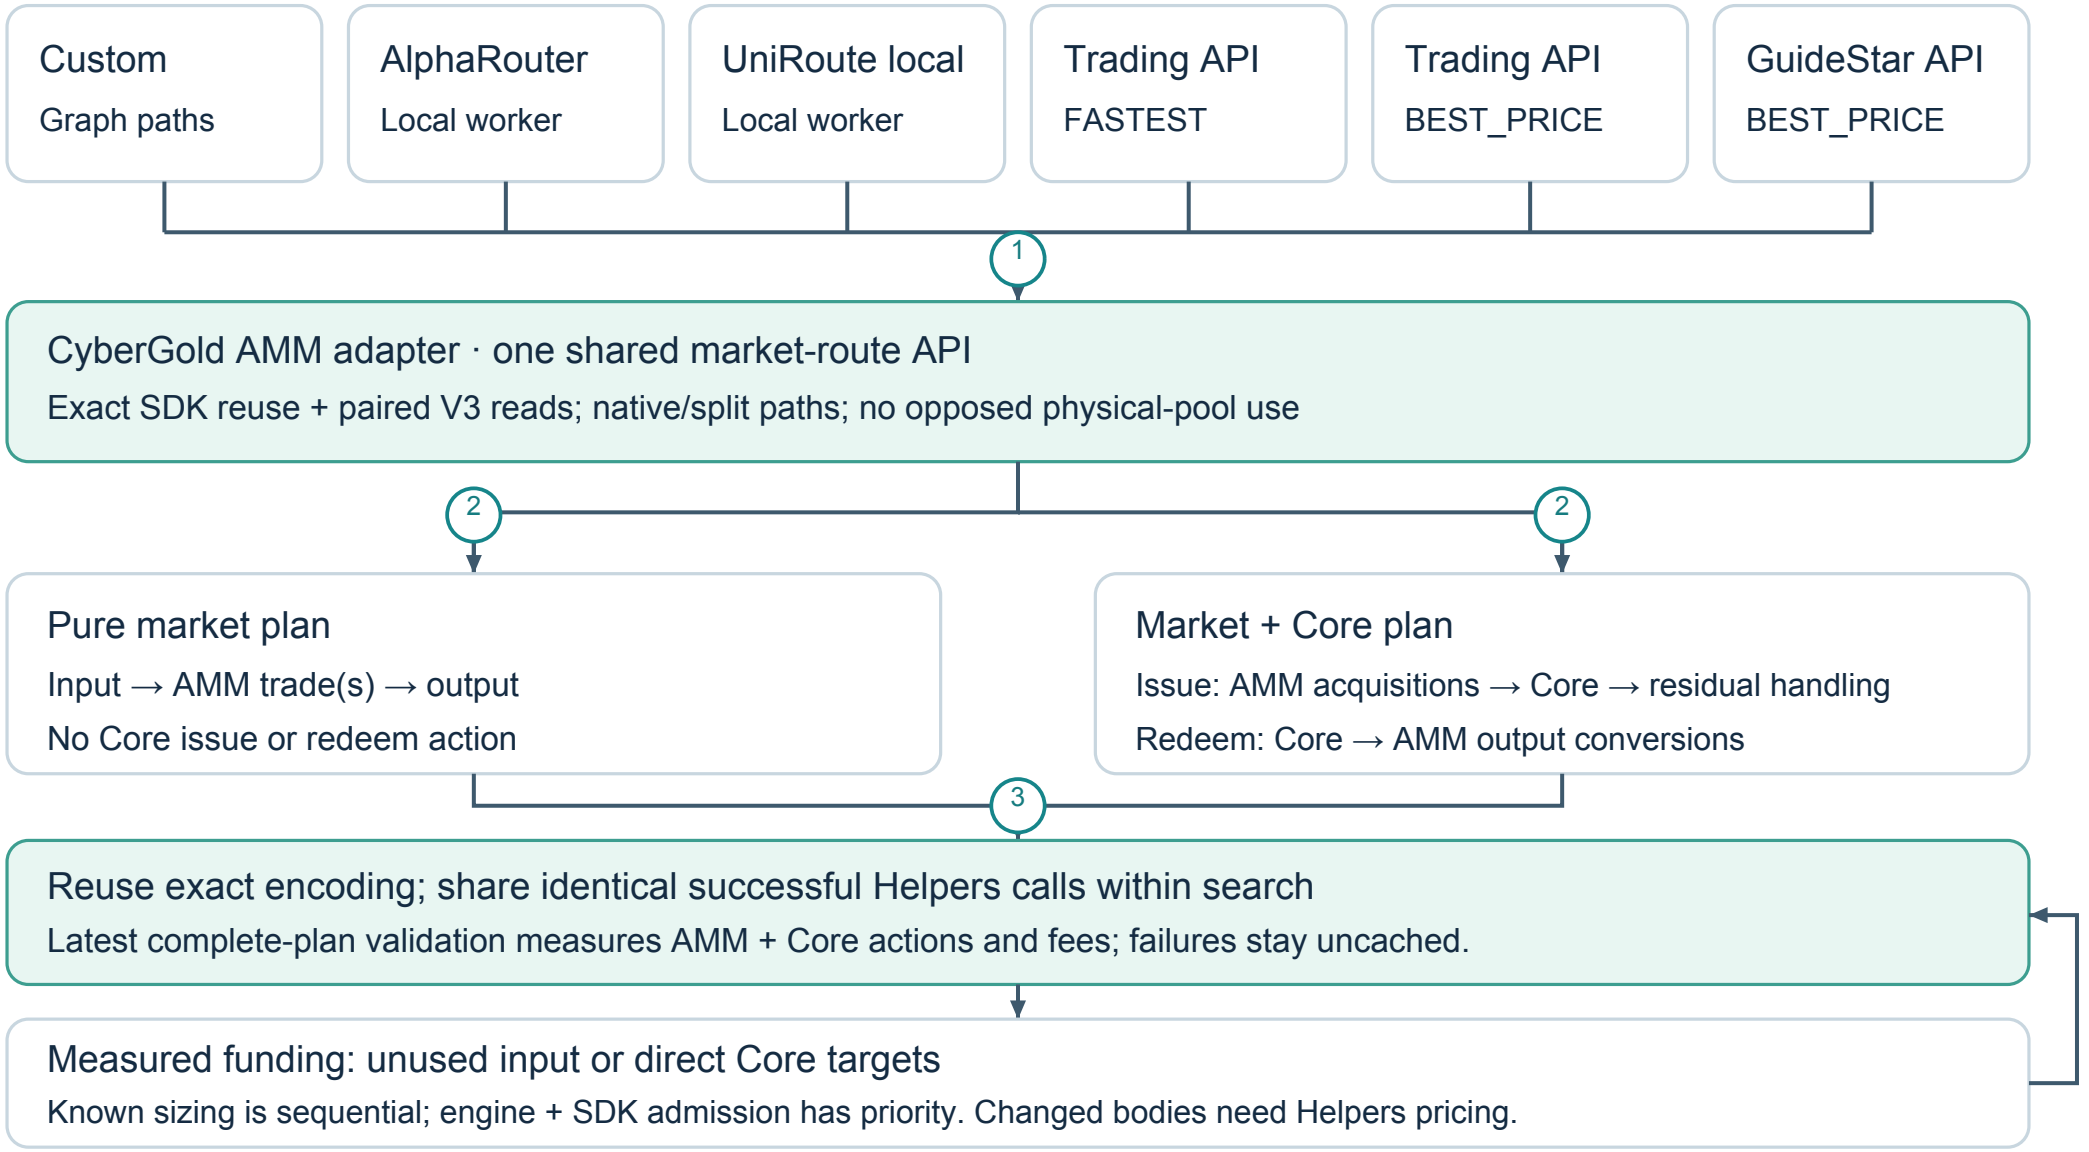
Before route/split expansion: skip only V3/V4 pools observed with sqrtRatioX96 = 0 in this search.
Unknown and initialized zero-liquidity pools stay eligible. Producer limits are local counts, not a global memory bound.

Sources: progressive_quotes / quote_publication; pool_initialization; route_scheduler, route_work_slots; calculation-session.

The same market tools serve both path families

Tools nominate AMM routes; Helpers measures the complete plan

Six demand-started suppliers; local AlphaRouter/UniRoute each admit eight response-outstanding callbacks



Pending/failed funding proposals do not erase the valid incumbent; changed bodies need Helpers pricing.
